

# MAXIMUM WATER TABLE ELEVATION OF THE UPPER FLORIDAN AQUIFER IN THE SUWANNEE RIVER WATER MANAGEMENT DISTRICT, FLORIDA

The contour lines on this map depict the maximum potentiometric surface of the Floridan aquifer system. The potentiometric surface is the height above mean sea level that the water table would have stood in tightly cased wells and the contours define areas with equal maximum water table elevations. Values represent the highest elevation recorded at each well from data that has been accumulated from as early as 1973, and do not represent a specific sampling in time. A significant number of record high water table levels were last recorded in 1998, when the region was impacted by heavy spring rainfall and two tropical storms.
